WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, Form 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. Troops in transit and certain small detachments are not required to submit reports; for this and other reasons, the total strength of the reporting units as shown herein has been consistently about four percent below the actual strength of the Army in the Continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

Admissions are reported only for cases hospitalized or confined to quarters and excused from duty for 24 hours or longer, except for certain cases carded for record only (chiefly venereal disease cases treated on a duty status, and deaths which occurred before admission to hospital or quarters). Admissions designated as "injury" comprise all traumas other than battle casualties (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, and reactions to medications as well as various types of wounds not due to enemy action). Under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties. All cases other than those of injury or battle casualty are classified as "disease."

Admission rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The average proportion of the daily strength of the command which is confined to hospital or quarters (mean number of non-effectives per thousand strength) is given in the summary table for the total United States and for each of the Service Commands. This ratio may not be significant when the strength of a Command is changing markedly or when a Command has a relatively large number of General Hospitals.

The number of enlisted men discharged during the week on Certificates of Disability for Discharge (CDD) are shown for individual stations. These data should be distinguished from the figures for "honorable discharges for physical and mental disqualification" published in the ASF Monthly Progress Report; the latter include discharges for inaptness in addition to CDD's and are assembled on a somewhat different basis (e.g., the April data represent April discharges processed by the AGO during April and May plus discharges prior to April which were processed in May).

MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 25 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of total beds authorized and total beds occupied.

Unless otherwise specified, beds authorized as shown in this report are defined in par. 36h of AR 40-1080, C 2. Total beds include expansion beds in addition to normal beds. Beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in the tabulations for individual stations.

Regional Hospitals are distinguished from Station Hospitals by the letters (RH) appearing after the name of the station.

In the case of General Hospitals there are shown, in addition, the number of Army patients admitted, the number disposed of during the week (by return to duty, transfer, death, CDD, or otherwise), and the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, subdivided by disease, injury, and battle casualty patients. The patient days of treatment are presented separately for hospital and for convalescent facilities. The bed capacity and beds occupied in convalescent facilities are also indicated.

EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where the current week's data for a particular station have not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 14 JULY 1944
COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES

All Causes: Disease and Injury:

During the week ending 14 July 1944 the admission rates from all causes, from all diseases combined, and from injury each increased by about 5 percent. The admission rate from all causes for this week was reported at 556 per thousand and the corresponding admission rate for disease at 480 per thousand. Both of these rates are nevertheless about 25 percent lower than for the corresponding week of 1943. Moreover, despite the current week's increase in morbidity from the very low level of the previous two weeks, the current week's admission rate from disease is more than 15 percent under the lowest rate experienced during 1943 (in November); in fact, ever since the week ending 31 March 1944 the admission rate from disease has been under the lowest rate experienced in 1943.

Morbidity from injury was reported at 76 per thousand, which is an increase to the second highest rate recorded for this cause this year; the highest rate, 78 per thousand, was registered for the week ending 23 June. Nonetheless, current morbidity from injury is about 25 percent lower than during July 1943.

Respiratory Causes:

Morbidity from colds, influenza, etc. remained the same as during the previous week or at a rate of 67 per year per thousand; this is the first time in 21 weeks that the rate from these causes did not decrease from one week to the next. Current morbidity is about 30 percent under the rate for the corresponding week of 1943 and is also about 25 percent lower than the minimum rate recorded in 1943 (during September).

The admission rate from pneumonia continued at 7 per thousand, or about 20 percent lower than for the corresponding week of 1943.

Common Communicable Diseases:

Morbidity from venereal disease (excluding cases contracted prior to entry into active service) increased sharply to 35 per thousand, the highest rate reported since the week ending 20 August 1943; current morbidity from these causes is about 35 percent greater than during the corresponding week of 1943. The admission rate for diarrhea and dysentery increased sharply to 14 per thousand but was nonetheless almost 50 percent lower than that for the corresponding week of 1943.

The number of new cases of measles, mumps, and scarlet fever remained close to the low figures reported the previous week. The number of new cases of meningitis increased somewhat to about the level which prevailed during the middle of June; this is considerably lower however than experienced during the early months of the year. The number of new cases of rheumatic fever again decreased by about 25 percent to reach the lowest figure reported since the week ending 24 December 1943. The number of new cases of poliomyelitis reported for the current week was 3, which was the same as for the previous week, but above the average for the year to date of 1 case per week.

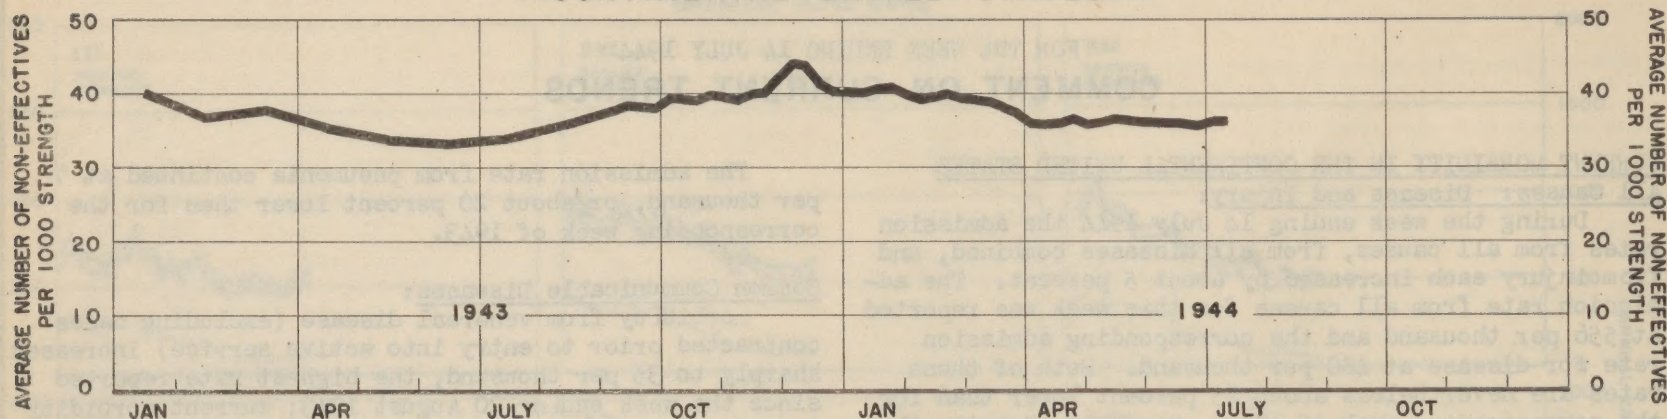

VARIATIONS IN MORBIDITY BY SERVICE COMMAND

All Causes: Disease and Injury:

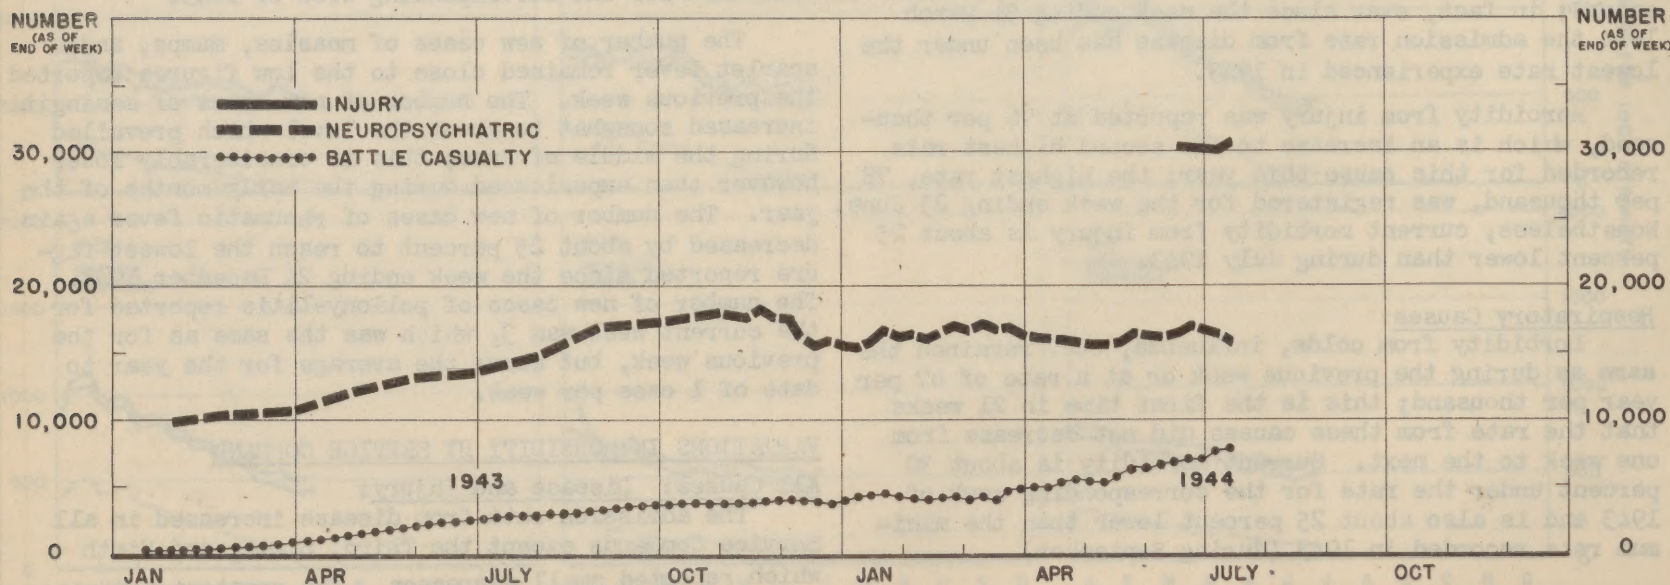

The admission rate from disease increased in all Service Commands except the Third, Sixth, and Ninth which reported small decreases. The greatest increases

RESTRICTED

NON-EFFECTIVE RATE CONTINENTAL UNITED STATES

PATIENTS REMAINING UNDER TREATMENT CONTINENTAL UNITED STATES

RESTRICTED

COMMENT ON CURRENT TRENDS (CONT'D)

(about 10 percent) were registered in the Second, Fourth, Fifth, and Eighth Service Commands. As a result the Second Service Command continued to report the highest admission rate from all causes (634 per thousand) and from disease (564 per thousand), while the Sixth Service Command again had the lowest morbidity from all causes (475 per thousand) and from disease (417 per thousand).

Sharp increases in the admission rate from injury were reported by the First, Fourth, Sixth, and Eighth Service Commands. The highest morbidity rates from this cause were reported by the Fifth, Eighth, and Ninth Service Commands, all of which had rates somewhat in excess of 80 per thousand. During the current week only two Service Commands, the Third and Sixth, reported admission rates from injury of less than 70 per thousand; this is in sharp contrast to the 1944 record low experience of the week ending 5 May 1944, during which all Service Commands reported admission rates from injury of less than 70 per thousand.

Respiratory Causes:

Even though the admission rate from colds, influenza, etc. for the total United States remained about the same, there was considerable variation in morbidity from these causes by Service Command. Increases of 15 percent or more occurred in the Third and Fourth Service Commands, while decreases of 15 percent or more were reported by the Military District of Washington and the Sixth Service Command. For the first time this year no Service Command reported an admission rate from these causes in excess of 85 per thousand, with only the First and Second Service Commands having rates above 75 per thousand. The Military District of Washington and the Sixth Service Command with admission rates of about 50 per thousand registered the lowest morbidity.

The highest morbidity from pneumonia continued to be reported by the Sixth Service Command (12 per

thousand), while the other Service Commands had rates closely approximating that for the United States as a whole (7 per thousand).

Common Communicable Diseases:

Morbidity from venereal diseases, excluding EPTS cases, increased sharply (by more than 20 percent) in the First, Fourth, Fifth, Eighth, and Ninth Service Commands. In fact, the Ninth Service Command registered an increase of almost 50 percent; the majority of this increase was due to higher morbidity at Benecia Arsenal, Calif., Camp Beale, Calif., and Camp Stoneman, Calif. The Fifth Service Command continued to report by far the highest admission rate (54 per thousand) from venereal diseases, excluding EPTS cases.

The increase in the morbidity rate from diarrhea and dysentery for the country as a whole was primarily the result of higher morbidity in the Fourth, Fifth, and Eighth Service Commands, all of which reported admission rates of about 20 per thousand; no other Service Command had morbidity from this cause in excess of 10 per thousand.

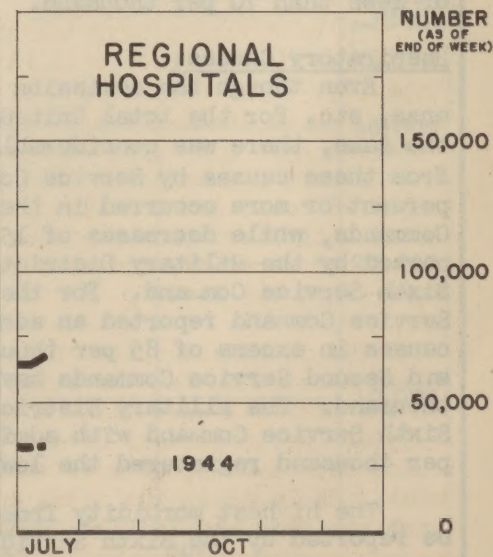

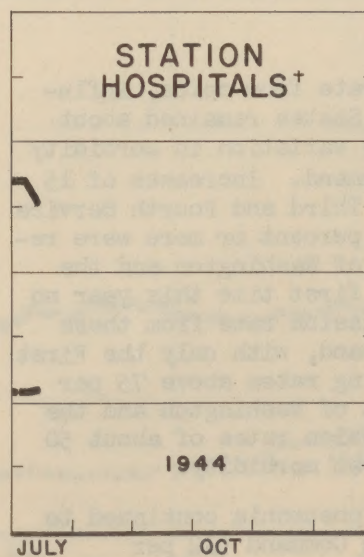

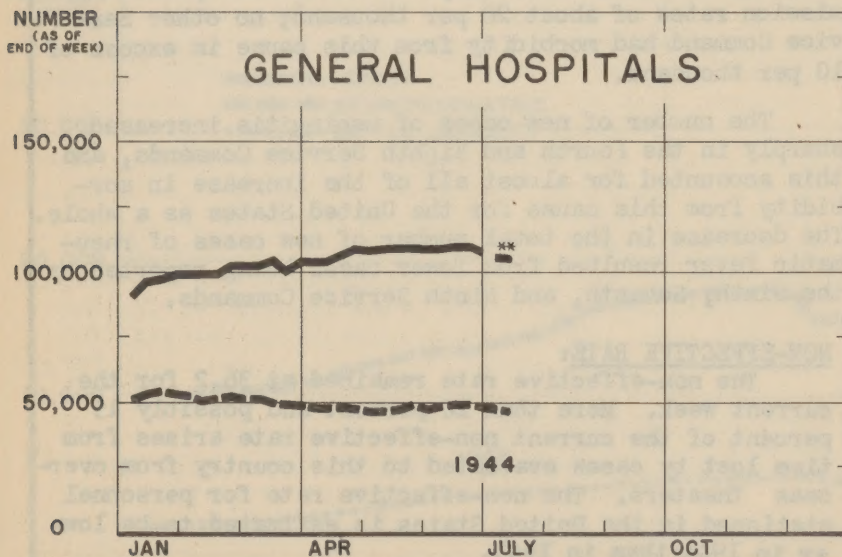

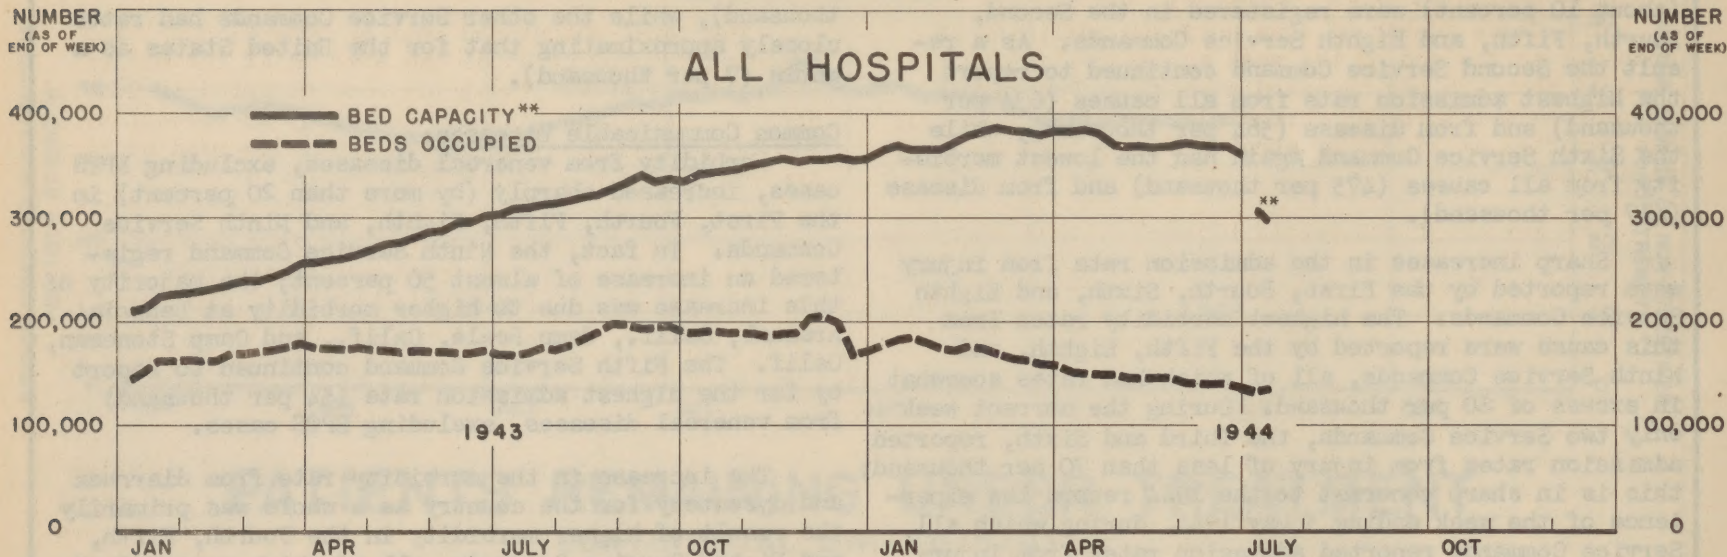

The number of new cases of meningitis increased sharply in the Fourth and Eighth Service Commands, and this accounted for almost all of the increase in morbidity from this cause for the United States as a whole. The decrease in the total number of new cases of rheumatic fever resulted from fewer cases being reported by the Sixth, Seventh, and Ninth Service Commands.

NON-EFFECTIVE RATE:

The non-effective rate remained at 36.2 for the current week. More than 10 percent and possibly 15 percent of the current non-effective rate arises from time lost by cases evacuated to this country from overseas theaters. The non-effective rate for personnel stationed in the United States is estimated to be lower in 1944 than in 1943.

COMMENT ON CURRENT TRENDS (CONT'D)

PATIENTS REMAINING UNDER TREATMENT:

The total number of Army patients remaining in hospital at the end of the week was equivalent to a rate of about 36 per thousand strength. The number of neuropsychiatric cases remaining as of 14 July 1944 was reported at 15,761 or about 500 less than the previous week.

The number of non-battle injury patients remaining under treatment in hospital and quarters as of 14 July 1944 totaled about 30,800 while the number of battle casualty patients remaining increased slightly to 7,753. All but 71 of the latter were in General Hospitals.

CERTIFICATES OF DISABILITY FOR DISCHARGE:

During the week ending 14 July 1944 the total number of enlisted men discharged by CDD was 2991 or about the same as the previous week. Almost one-half of these discharges were reported by General Hospitals.

CURRENT HOSPITAL CONDITIONS:

In this report hospitalization data are presented in terms of authorized beds rather than in terms of bed capacity. (For definitions of beds authorized see paragraph 36h of AR 40-1080, C 2.) In a few instances where stations have not reported the number of authorized beds, the figures presented in this report are those for the reported total bed capacity. It should be noted that the total authorized beds may equal but cannot exceed the total bed capacity, and as a rule the former will be lower than the latter.

The total authorized beds as of 14 July 1944 numbered about 298,000, or about 7,000 less than at the end of the previous week. The total number of beds occupied was 135,000 (or 45 percent of the total beds authorized) which was about 1,000 more than at the end of the previous week. Included in the total authorized beds were 270 T/O hospital beds and tentage, none of which were occupied.

The total authorized beds in General Hospitals numbered 105,000 or about the same as at the end of the previous week. The total beds occupied in General Hospitals were about 47,000 (or about 45 percent of the authorized beds) which was about the same as at the end of the previous week.

Station hospitals (as distinct from Regional Hospitals) reported 126,000 total authorized beds, while the Regional Hospitals reported about 67,000 beds. The number of beds occupied at station hospitals was about 55,000 or 44 percent of the total authorized beds. The beds occupied at Regional Hospitals numbered 33,000 or 49 percent of the total authorized beds.

As of 14 July 1944 the bed capacity of convalescent facilities in General Hospitals was 15,580 which was an increase of about 400 as compared with the previous week. The total beds occupied in such convalescent facilities was 4,621 which was 30 percent of the total bed capacity.

FORM 96-902-8 July 1944

RESTRICTED

SUPPLEMENTARY HEALTH REPORT

FOR THE FOUR WEEK PERIOD ENDING 26 MAY 1944 VENEREAL DISEASE ADMISSION RATES

This Supplementary Health Report presents a study of the venereal disease admission rates by color for all units in the continental United States reporting on Form 86ab. The data cover the four week period ending 26 May 1944 and are presented for individual stations only where the mean colored male strength was 1000 or over, with the data for all other units being grouped together within each Service Command.

In considering venereal disease morbidity during May reference should be made to the Supplementary Health Report contained in the Weekly Health Report for the week ending 16 June 1944 in which venereal disease admission rates are shown for individual stations for all Army personnel combined. On page 38 of that report are set forth the number of cases remaining under treatment in each Service Command at the end of May. The total venereal cases remaining under treatment accounted for 2.3 percent of all types of cases under treatment. The corresponding days lost due to venereal diseases during the four week period ending 26 May 1944 totaled 96,000 representing a non-effective rate of .81 per thousand. Of the 96,000 days lost due to venereal diseases about 42,000 days were attributable to colored male personnel. The non-effective rates from venereal disease for colored males was about 4.3 per thousand, while for all other personnel it was about .50 per thousand.

Morbidity from venereal disease, excluding EPTS cases, for total Army personnel was at a rate of 32 per thousand in May or somewhat higher than during the previous month. For colored males the May rate was 153 per thousand, while for "all other" Army personnel it was only 21 per thousand, both rates being about 10

percent higher than during April. Thus, morbidity of male colored personnel from venereal diseases has continued about 7 times as high as for other Army personnel.

Considering the specific venereal diagnoses (excluding EPTS cases), the syphilis rate for colored males was about 15 times as high as for other Army personnel, but for gonorrhea the colored male experience was only about 6 times as high. Venereal diseases other than gonorrhea and syphilis were practically all found among the colored males, who accounted for over 80 percent of the total cases although less than 10 percent of the total strength of the Army. The admission rate from such venereal diseases was 13 per thousand for colored males as contrasted with only .25 per thousand for the remainder of the Army.

Morbidity from venereal EPTS cases (predominately syphilis) was reported at 20 per thousand for the total Army, with corresponding rates of 196 and 5 per thousand for colored males and the remainder of the Army respectively. Variations in the admission rate for venereal EPTS cases reflect entirely the experience among the current inductees, so that variations by Service Command or by individual station have little significance. Quite naturally induction centers have very high rates, whereas other stations show few cases or none at all.

As in previous months, the Second Service Command reported by far the highest morbidity from venereal disease, excluding EPTS cases, for colored males; this rate of 321 per thousand was more than double the colored rate for the country as a whole. The very

SUPPLEMENTARY HEALTH REPORT

FOR THE FOUR WEEK PERIOD ENDING 26 MAY 1944

VENEREAL DISEASE ADMISSION RATES (CONT'D)

high morbidity at Camp Kilmer and Camp Shanks, which include large numbers of task force troops not under the jurisdiction of the Second Service Command, was in the main responsible for the high admission rate of the Second Service Command. The Sixth Service Command showed the next highest morbidity for colored troops with a rate of 204 per thousand, while the Third Service Command and The Military District of Washington, with rates of 121 and 86 per thousand respectively, were the lowest.

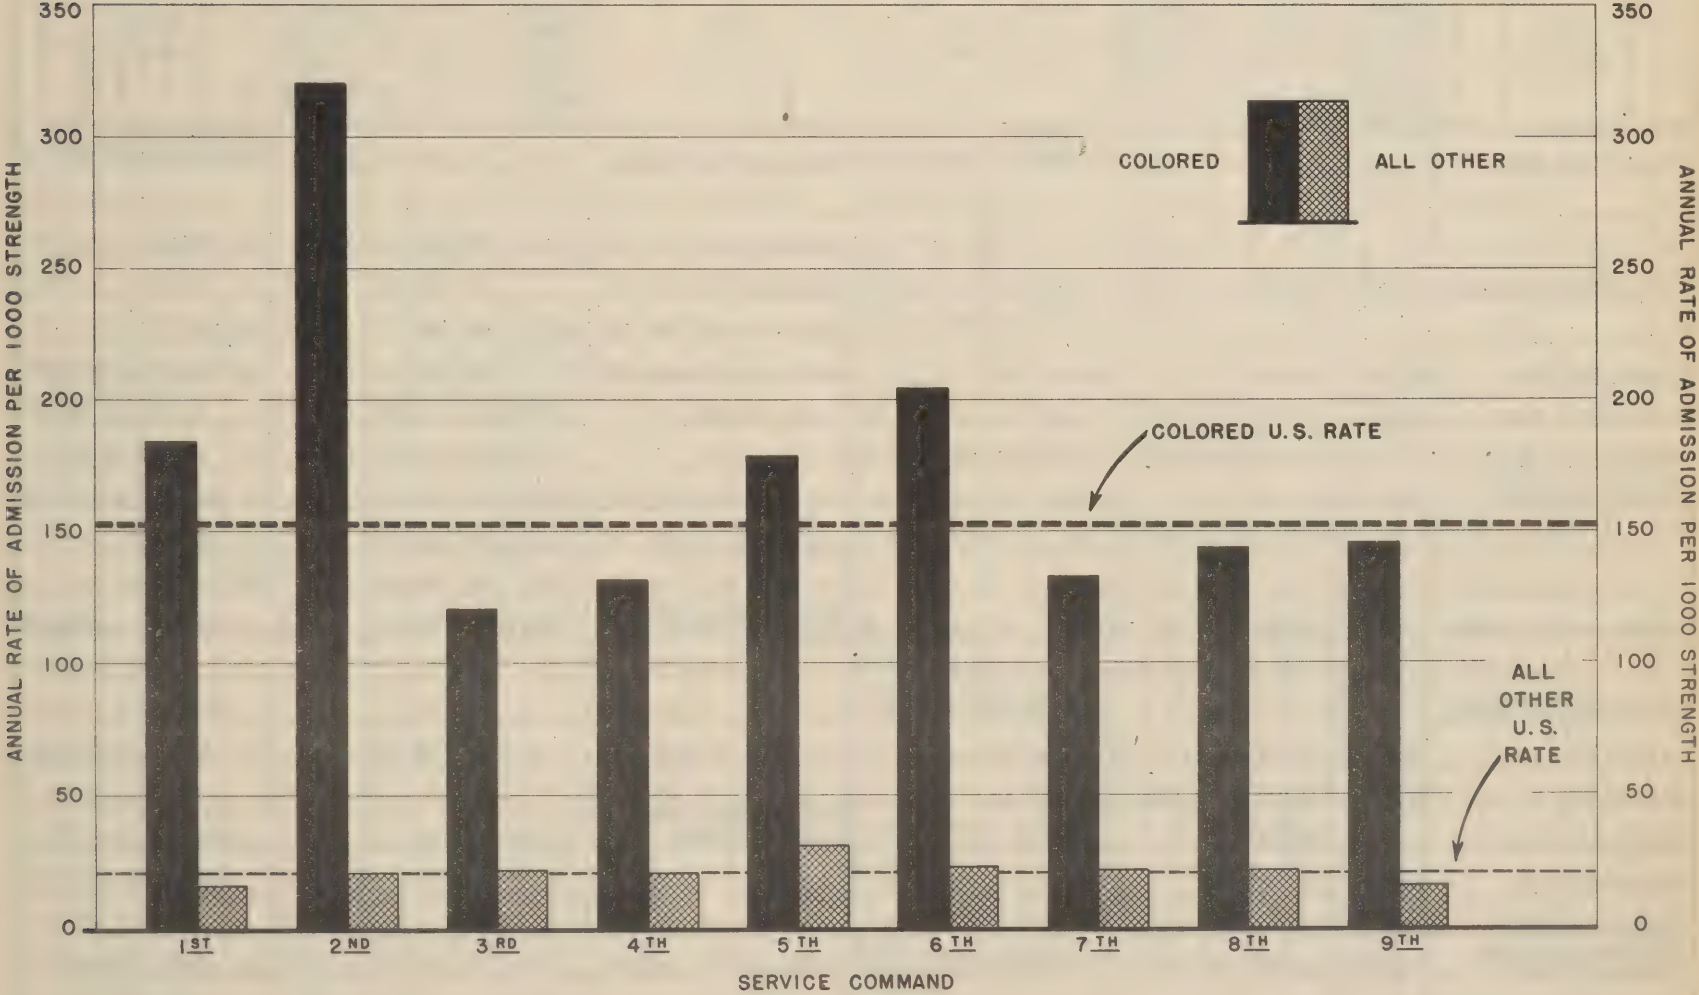

There was relatively little variation by Service Command in the morbidity from venereal disease, excluding EPTS cases, for the remainder of the Army. The majority of the Service Commands had rates within the range of 21 to 23 per thousand strength. The Military District of Washington, however, reported morbidity from this cause of only 10 per thousand, while the Fifth Service Command showed a rate of 31 per thousand.

Admission rates for colored males from venereal diseases, excluding EPTS cases, in excess of 300 per thousand were reported by the following stations: Camp Kilmer, N.J., Camp Shanks, N.Y., Camp Swift, Texas, Los Angeles, PoE, Calif. and Camp Stoneman, Calif.

The highest rates of admission for colored males for syphilis excluding EPTS cases were reported for Camp Patrick Henry, Va. (107 per thousand), Camp Kilmer, N.J. (86 per thousand), and Camp Barkeley, Texas (84 per thousand). The highest rates for colored males from other venereal diseases excluding EPTS cases were reported at Camp Kilmer, N.J. (110 per thousand), Fort Lawton, Wash. (101 per thousand), and Greensboro BTC, N.C. (89 per thousand).

SUPPLEMENTARY HEALTH REPORT

CONVALESCENT FACILITIES AT REGIONAL AND STATION HOSPITALS

Data regarding convalescent facilities at Regional and Station Hospitals for the week ending 30 June 1944 are shown on page 40. Corresponding data for General Hospitals are published currently in the Weekly Health Report (pages 28 to 31).

As of 30 June 1944 there were 18 Regional Hospitals, 5 Convalescent Hospitals, and 18 Station Hospitals reporting data on convalescent facilities. The total bed capacity of the convalescent facilities at these 41 hospitals was 12,593; 4,578 of the beds (or 36 percent) were occupied. It is noteworthy that of the total convalescent bed capacity reported at Regional and Station Hospitals over 70 percent is concentrated in the Seventh and Eighth Service Commands.

In comparison with the convalescent facilities at the 41 Regional, Convalescent, and Station Hospitals, some 35 General Hospitals (out of a total of 58) reported as of 30 June 1944 a total convalescent bed capacity of 14,558; of these 4,594 (or 32 percent) were occupied. Thus, the convalescent facilities at Regional, Convalescent, and Station Hospitals had about the same number of beds occupied as the convalescent facilities at General Hospitals, even though the latter had a somewhat larger bed capacity.

The stations with the largest convalescent facilities bed capacities were Ft. Logan, Colo., Albuquerque, N. Mex., and Ft. George Wright, Wash., all of which are designated Convalescent Hospitals (ZI). Each of these has a convalescent bed capacity of more than 1000 beds. Since these installations have been set up quite recently, the proportion of beds occupied is still very low. Thus at Albuquerque, with a convalescent bed capacity of 2000, only 31 beds were occupied on 30 June; however, by 14 July the number of beds occupied had increased to 50, and may be expected to increase steadily as time goes on.

In connection with the reports on the reconditioning program to be published in the future, it is intended to give more detailed analyses of the convalescent facilities at Regional and Station Hospitals. However, it should be noted that many hospitals will maintain reconditioning programs even though they have no buildings specially designated as convalescent facilities [see par. 36b(3) for definition of this term].
